Name	Date	Reason For Changes	Version
B09	2026.05.15	Initial approved version	1.0

1. Brief description

This test report summarizes the testing results for the Mentor Caring System. The testing was conducted according to the approved test plan version 1.0. The main testing scope included three core use cases: Search Student's Info, Edit Interview Record, and Search Mentor Info.

The Search Student's Info function was tested for Mentor and MCP Coordinator users. The testing focused on valid student ID search, empty student ID input, non-existing student ID, invalid student ID input, incorrect student ID format, role-based access control, navigation operation, and GUI operation replay. TestComplete was used for the GUI testing of this function.

The Edit Interview Record function was tested for Mentor users. The testing focused on adding, modifying, deleting, saving, and canceling interview records. It also covered required field validation, invalid date or time format, excessive text length, unauthorized access, data persistence after saving, and system behavior under load. LoadRunner was used to record and replay the web script and to observe system behavior when the related process was executed under load.

The Search Mentor Info function was tested for Faculty Consultant and MCP Coordinator users. The testing focused on valid mentor name search, valid mentor email search, valid group ID search, invalid input, empty search fields, no matching results, group member display, student record navigation, and role-based access control.

During the testing process, the main selected testing activities were completed. The TestComplete evidence showed that the recorded keyword test steps and property checkpoints were created for Search Student's Info. The LoadRunner evidence showed that the web script was generated and replayed successfully. No critical test execution error was found in the captured test evidence.

2. Test date and performer

The test was performed on 2026.05.15.

The performers of the test were members of group B09.

The testing was carried out based on the test cases defined in the approved test plan for the Mentor Caring System. The main testing level was system testing. The main testing method was black-box testing.

The tools involved in the testing were TestComplete and LoadRunner. TestComplete was used for the GUI testing of Search Student's Info. LoadRunner was used for recording,

replaying, and checking the web-based test script.

3. References

The following documents were used as references for this test report.

1. B09_TestPlan_ver1.0.
2. Software Requirements Specification for Mentor Caring System, Version 1.4 approved.
3. UI Diagram, User Interface document for Mentor Caring System.
4. Design and Implementation of a Mentor Caring System, Project Long Description, Version 1.2, 2025–2026.
5. Lab 11 Tasks PPT.

4. Error report

According to the captured TestComplete and LoadRunner evidence, no critical execution error was found. The recorded TestComplete keyword test and checkpoints were available for review. The LoadRunner script was generated and the replay status was successful. Therefore, no unexpected error item is listed in this error report.

Test case ID	Expected result	Actual result
N/A	No unexpected execution error should occur during the recorded testing activities.	No critical execution error was found in the captured TestComplete and LoadRunner evidence.

5. Appendix

This appendix provides additional information about the testing evidence, tested modules, testing tools, and overall test conclusion.

5.1 LoadRunner script evidence

Figure 1 shows the LoadRunner VuGen script after recording the web-based process. The Step Navigator on the left lists the recorded actions, including URL access, custom requests, think time, and request headers. The `Action.c` script on the right shows the generated HTTP/HTML script content for the recorded test process. The bottom status bar shows that the script parsing succeeded and the replay status passed.

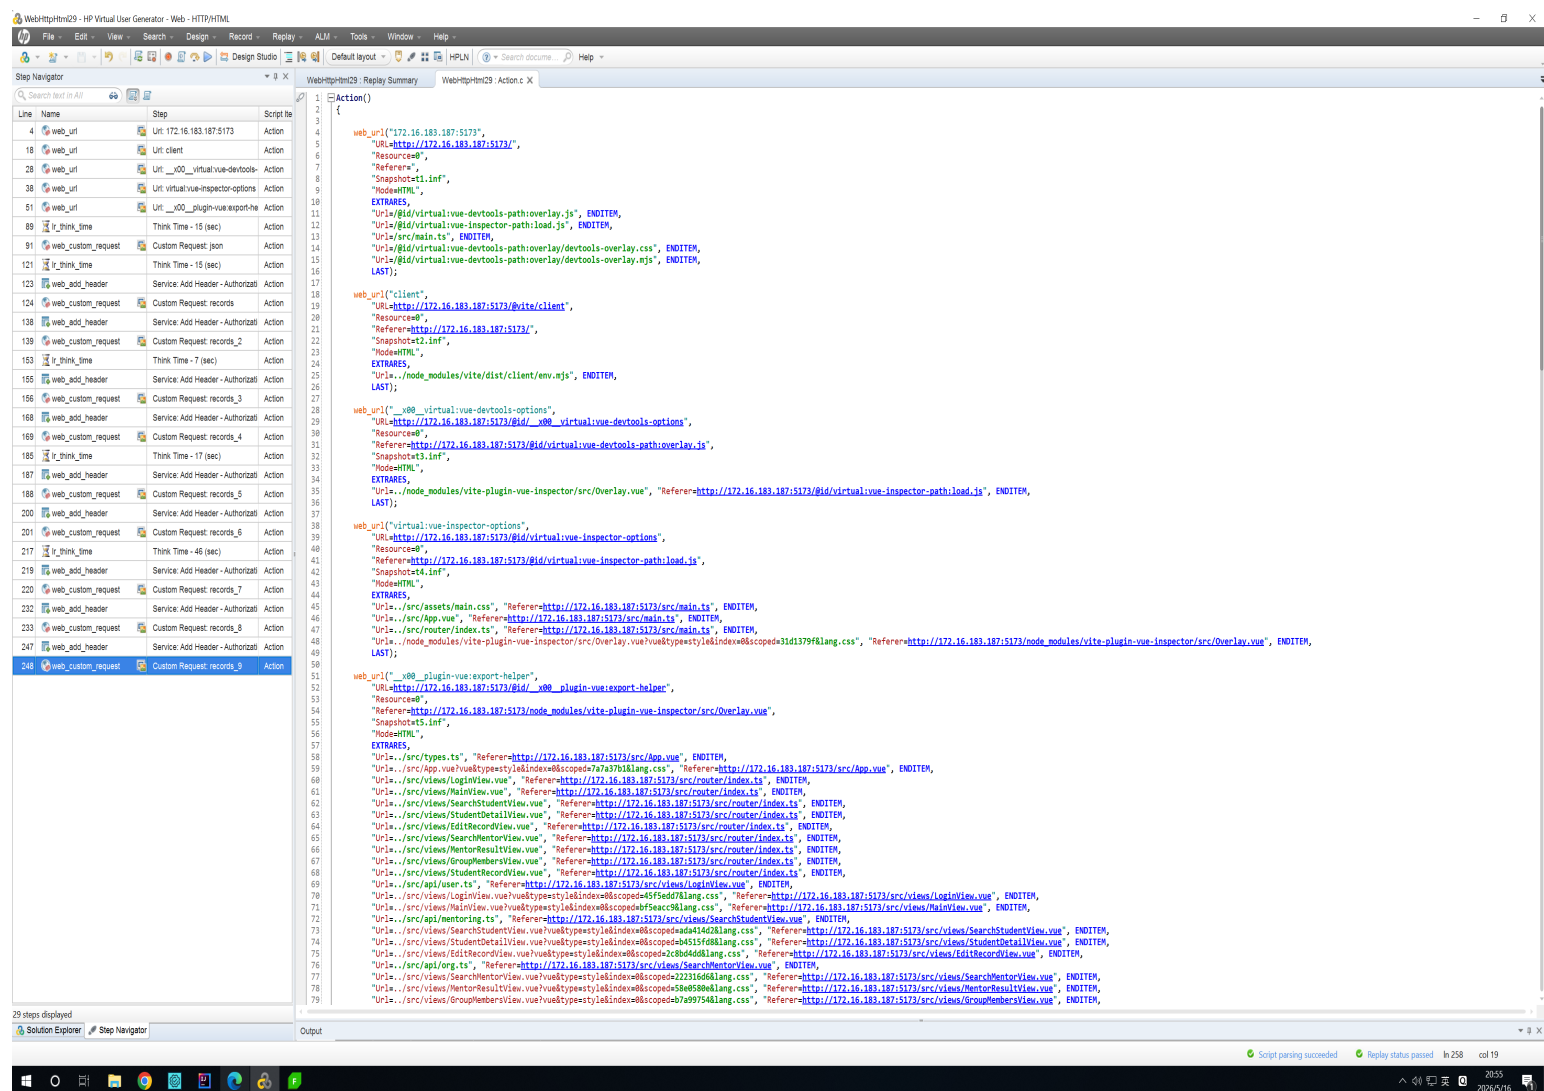

Figure 1: LoadRunner VuGen Recorded Script and Action.c Details

5.2 Tested modules

The following modules were tested in this test report.

1. Search Student's Info
2. Edit Interview Record
3. Search Mentor Info

5.3 Search Student's Info testing summary

The Search Student's Info function was tested for Mentor and MCP Coordinator users. The test cases covered valid student ID search, unauthorized access, non-existing student ID, empty student ID input, invalid student ID input, incorrect student ID format, navigation operation, and GUI replay.

The updated test plan added SSI-10 to check the situation where the input student ID format is incorrect. This update is reflected in this report. The expected behavior is that the system should reject the incorrect ID format, display a clear format warning message, and remain on the Search Student Info page.

TestComplete was used to record the Search Student's Info operation and to configure property checkpoints. The testing evidence showed that the keyword test steps and checkpoints were available for validating the search result and warning message display.

5.4 Edit Interview Record testing summary

The Edit Interview Record function was tested for Mentor users. The precondition was that the mentor had already logged in and had already searched for a student in the mentor's own group.

The test cases covered opening an existing student record, adding a new interview record, modifying an existing interview record, deleting an interview record, canceling unsaved changes, required field validation, invalid date or time format, text length validation, unauthorized editing, data persistence, and LoadRunner-based testing.

LoadRunner VuGen was used to record and generate the web script. The screenshots in the appendix show the recorded web requests and the generated `Action.c` script. The recorded script can be used for replay and further load testing. The captured evidence did not show a critical replay failure.

5.5 Search Mentor Info testing summary

The Search Mentor Info function was tested for Faculty Consultant and MCP Coordinator users. The test cases covered mentor name search, mentor email search, group ID search, authorized search, unauthorized search, invalid or non-existing mentor information, empty input, group member display, student record navigation, and page navigation.

The expected behavior is that authorized users can search and view mentor information within their permitted scope. For invalid input or unauthorized scope, the system should display a clear warning message or prevent unauthorized information from being displayed.

5.6 Overall test conclusion

According to the captured testing evidence, the selected testing activities for the Mentor Caring System were completed. The Search Student's Info test cases were updated to include incorrect student ID format checking. The TestComplete evidence supported GUI testing and checkpoint verification. The LoadRunner evidence showed that the web script was recorded and generated successfully.

Overall, the main user flows of the Mentor Caring System can be tested through the selected tools. Users can search student information, edit interview records, search mentor information, view group members, and navigate to student records. For future work, the team should continue regression testing after any functional modification, especially for student ID format validation, warning message display, role-based access control, and LoadRunner script stability.
